

# Mini & Micro Computers

## Mini Computer

Mini Computer is such a computer which is capable to handle all the client/terminal computers connected via LAN or MAN. These computers must be more powerful and fast processing than the Sum of all computers connected to that network. Only IBM makes these computers. These computers are also called Servers. These cost in Lacks varying in their capability and particles/components used. Ex, if we have a network of 20 terminals having 20 GB of hard Disk each. Thus server must have twice of more storage than these all (400 GB or more). So It could process all the tasks quickly.

## Mainframe Computer

These are servers of Servers. These are only produced by IBM (International Business Machine Co. Ltd.). These are capable to control the servers of networks used in worldwide databases. These are mainly used for Web Hosting and Important databases in Internet. Railways, Airlines etc.

**Specially qualified persons are required to operate these Computers. Who is also called System Administrator.**
